

### **BookProvider & BookEntityManager**

- No implementation of Delete and Update function
- Show only first name of Author in MainActivity and list all author name in ViewBookActivity
- Save only first name of Author (no middle or last name)

### **ChatServer**

- In the assignment does not mention about "public String getType(Uri uri)" So I did not implement this function
- Since the boilerplate, setting for client name and port is in the server app but when receive data the code split(":") and takes the first index as the sender name (it confuses that where should client name and port come from. So I follow the boilerplate, put setting in the server side.
  - However, because the setting is in the server side if I use "receivePacket.getPort();" for get sender port, the result will not change by the setting. So I save sender port from server side setting instate (server's port) for showing that the application saves the latest sender information in database

***All APK is in release folder***
